

The Anatomy of Definitive's Revolutionary BDSS Mid/Bass Driver

BDSS technology is the key to the high definition, stunningly life-like vocal and midrange-instrument reproduction of Definitive Technology loudspeakers

Magnetic system optimized by finite element analysis to maximize magnetic flux in the gap for high efficiency and linear excursion

High temperature, oversized, lightweight vented voice coil for improved power handling and quick transient response; extended voice coil for increased linearity and lower distortion.

Die-cast Aluminum basket minimizes ringing and vibration while the open area minimizes back wave reflections

BDSS (balanced double surround system) surrounds support the cone at two points to provide better mechanical stability for longer, more linear excursion and improved damping to suppress parasitic cone resonance. The result is clear, accurate and detailed sound.

Waveguide smoothes off-axis response for broad, even dispersion and better imaging. Everyone in the room hears well balanced sound with a life-like representation of instruments.

Deeply drawn mineral-filled mono-polymer cone engineered using sophisticated 3D modeling techniques for tonal accuracy that makes all genres of music and movie soundtracks come alive
